Habitats Regulations Assessment document: FARNE – tLSE 024

European Marine Site: Farne Islands SPA

Generic sub-feature(s): Pursuit & Plunge diving birds, Benthic feeding

birds, Water column

Gear type(s): Entangling nets

NIFCA tLSE type: Detailed

Gear/feature interaction FARNE-123

reference(s):¹ FARNE-125

FARNE-270

Revision history		
Date Revision Edito		Editor
07/01/2016	Document created	VR
11/02/2016	Document revised following consultation with Natural England (05/02/16)	SM
13/06/2016	Document revised following consultation with Natural England (10/06/16)	VR

Has Natural England been formally consulted on	Yes
this tLSE (and do they agree)?	

Date of document completion/'sign-off':	13/06/2016

Test for Likely Significant Effect (LSE)

FARNE-123: Plunge & Pursuit Diving Birds

1. Is the activity/activities directly connected with or necessary to the management of the site for nature	No
conservation?	
2. What pressures (such as abrasion, disturbance) are potentially exerted by	Above water noise (Sensitive) ¹
the gear type(s)?	Collision ABOVE and BELOW water with static or moving objects not naturally found in the marine environment. (Sensitive) ²
*Sensitivities as listed are based on DRAFT Interim conservation advice. No Regulation 33 or	Latar duration or annual of more indicate and of a constitution (Constitution)
35 Advice is available for the Farne Islands SPA	Introduction or spread of non-indigenous species (Sensitive) ³
and best judgement has been used to determine which of these pressures are truly exerted by the gear type(s).	Litter i.e. Ghost fishing (Sensitive) ⁴
	Removal of non-target species i.e. bycatch (Sensitive) ⁵
	Visual disturbance (Sensitive) ⁶
	Selective extraction of species (i.e. removal of target species) ^{7,8}
3. Is the feature potentially exposed to	Yes
the pressure(s)?	

4. What are the conservation objectives for the feature?

*DRAFT interim conservation advice does not give definitive conservation objectives.

However, completing an HRA without COs is difficult. The CO as listed in this document is based on current knowledge of the status, and the pressures, affecting designated features (see sections 4 &5).

Expert judgement has been used to determine which features may be exposed to the pressure(s) resulting in inferred COs. These COs are assigned a degree of uncertainty i.e. a subjective confidence level based on evidence 'High', 'Medium,' 'Low', and 'Unknown'.

Conservation objective for plunge & pursuit diving birds: **Recover*:**

- the size of the population at a level which is above either the population-size included on the SPA Citation or an alternative baseline-population previously approved by Natural England Chief Scientist or that based on the current mean peak count or equivalent, whichever is the higher.
- the abundance and structure of the assemblage at or above its current or target level (whichever is the higher) through [maintaining/restoring] breeding productivity and adult survival.
- water quality and quantity to a standard which provides the necessary conditions to support the SPA feature, where the supporting habitats of the feature are dependent on surface water.
- the extent, distribution and availability of suitable breeding habitat which supports the feature for all necessary stages of its breeding cycle (courtship, nesting, feeding).

Those conservation objectives that might be affected by entangling netting activities are underlined.

*Confidence level for interim, inferred Conservation Objectives: **MEDIUM** (see section 6 for detail).

5. What are the potential effects/impacts of the pressure(s) on the feature, taking into account the exposure level?

Levels of netting activity within the surrounding waters of the Farne Islands SPA are currently very low, with just one or two boats known to set nets on an infrequent basis (Jon Green, pers. comms.). The SPA site is managed by the National Trust, and staff members have not observed nets set in close proximity of the site; nets are generally set further south (John Walton, Coastal & Marine Officer National Trust, pers. comms. 17/04/2014). There have also been no reports of any classified SPA bird species caught within nets around the Farne Islands in 2014 or 2015 (Ed Tooth, National Trust Farnes Ranger. Pers. comms. 23/02/16).

NIFCA Byelaw 6 (Fixed Engines) includes a number of technical, spatial and temporal restrictions designed to minimise the potential of accidental bycatch of birds within the district. For instance, between 26^{th} March -31^{st} October it is prohibited to set a fixed engine in waters less than 7m depth and the headline of the fixed engine must be at least 4m below the surface of the water.

Given the current low levels of activity and the lack of reports of seabird bycatch in nets around the Farne Islands, it is unlikely that entangling netting is having a significant adverse impact; however more information is needed to confirm this.

6. Condition and Conservation Objective Inferences

The national trend of Atlantic puffins abundance is declining which has resulted in this species being added to the IUCN Red List. The Farne Islands' population has fluctuated over the last 10 years, and had a poor 2015 season attributed to flooding of burrows, resulting in reduced productivity¹⁶. Guillemot numbers on the SPA site are increasing, with 35,820 pairs recorded in 2015, a 3% increase from 2014 and a 2555% increase since records began in 1971¹⁶.

No conservation objective is provided for combined feature for 'Pursuit and Plunge diving birds' and with contrasting population trends, Conservation Objectives have been assigned to the individual species; 'Maintain' for guillemots and 'Recover' for puffins - 'Recover' overall for this feature. These have been inferred from the National Trust's 2015 report for breeding birds on the Farne with a medium level of confidence.

7. Is the potential scale or magnitude of any effect likely to be significant?	Alone:	OR In-combination
	No	No
	*However a full Appropriate Assessment is required to confirm this.	
8. Have NE been consulted on this LSE	Yes	
test? If yes, what was NE's advice?		
	Synthesis of evidence and local knowledge informing this decision occurred between January 2014 and the date of this document's creation with stakeholders (where appropriate) and other statutory authorities. Natural England (CS) was involved with this formal process.	

Conclusion

Is the proposal likely to have a significant effect 'alone or in combination' on the Farne Islands SPA?

No, however a full Appropriate Assessment is required to confirm this.

Test for Likely Significant Effect (LSE)

FARNE-125: Benthic Feeding Birds

1. Is the activity/activities directly	No
connected with or necessary to the	
management of the site for nature	
conservation?	

2. What pressures (such as abrasion, disturbance) are potentially exerted by the gear type(s)?

*Sensitivities as listed are based on DRAFT Interim conservation advice. No Regulation 33 or 35 Advice is available for the Farne Islands SPA and best judgement has been used to determine which of these pressures are truly exerted by the gear type(s).

Above water noise (Sensitive)¹

Barrier to species movement

Collision ABOVE and BELOW water with static or moving objects not naturally found in the marine environment. (Sensitive) 2

Introduction of Light⁹

Introduction or spread of non-indigenous species (Sensitive)³

Litter i.e. Ghost fishing (Sensitive)⁴

Removal of non-target species i.e. bycatch (Sensitive)⁵

Visual disturbance (Sensitive)⁶

Selective extraction of species (i.e. removal of target species)^{7,8}

3. Is the feature potentially exposed to the pressure(s)?

Yes

4. What are the conservation objectives for the feature?

*DRAFT interim conservation advice does not give definitive conservation objectives.

However, completing an HRA without COs is difficult. The CO as listed in this document is based on current knowledge of the status, and the pressures, affecting designated features (see sections 4 &5).

Expert judgement has been used to determine which features may be exposed to the pressure(s) resulting in inferred COs. These COs are assigned a degree of uncertainty i.e. a subjective confidence level based on evidence 'High', 'Medium,' 'Low', and 'Unknown'.

Conservation objective for benthic feeding birds: **Maintain*:**

- the size of the population at a level which is above either the population-size included on the SPA Citation or an alternative baseline-population previously approved by Natural England Chief Scientist or that based on the current mean peak count or equivalent, whichever is the higher.
- the structure, function and supporting processes associated with the feature and its supporting habitat through management or other measures (whether within and/or outside the site boundary as appropriate) and ensure these measures are not being undermined or compromised.
- the abundance and structure of the assemblage at or above its current or target level (whichever is the higher) through [maintaining/restoring] breeding productivity and adult survival.
- the extent, distribution and availability of suitable breeding habitat which supports the feature for all necessary stages of its breeding cycle (courtship, nesting, feeding).
- water quality and quantity to a standard which provides the necessary conditions to support the SPA feature, where the supporting habitats of the feature are dependent on surface water.
- <u>availability of key prey species (e.g. sandeel, sprat) at preferred prey sizes.</u>

Those conservation objectives that might be affected by entangling netting activities are underlined.

*Confidence level for interim, inferred Conservation Objective: **MEDIUM** (see section 6 for detail).

5. What are the potential effects/impacts of the pressure(s) on the feature, taking into account the exposure level?

Levels of netting activity within the surrounding waters of the Farne Islands SPA are currently very low, with just one or two boats known to set nets on an infrequent basis (Jon Green, pers. comms.). The SPA site is managed by the National Trust, and staff members have not observed nets set in close proximity of the site; nets are generally set further south (John Walton, Coastal & Marine Officer National Trust, pers. comms. 17/04/2014). There have also been no reports of any classified SPA bird species caught within nets around the Farne Islands in 2014 or 2015 (Ed Tooth, National Trust Farnes Ranger. Pers. comms. 23/02/16).

NIFCA Byelaw 6 (Fixed Engines) includes a number of technical, spatial and temporal restrictions designed to minimise the potential of accidental bycatch of birds within the district. For instance, between 26^{th} March -31^{st} October it is prohibited to set a fixed engine in waters less than 7m depth and the headline of the fixed engine must be at least 4m below the surface of the water.

Given the foraging behaviour of benthic feeding seabirds and the current low levels of netting activity within the vicinity of the Farne Islands SPA, there have been no reports of benthic feeding birds being caught in nets around the Farne Islands and it is unlikely that entangling netting is having a significant adverse impact on benthic feeding seabirds within the site; however more information is needed to confirm this.

6. Condition and Conservation Objective Inferences

Benthic feeding seabirds are not included as a designated feature of the Farne Islands SPA in the Interim Conservation Advice (2015), however they are present at the site and are a classified bird species (e.g. Common eider). Eider duck numbers dropped on the Farne Islands in 2015 by 10.79% although productivity only dropped by ~5%¹⁶. Good numbers of other benthic feeding birds such as the Oystercatcher and Ringed Plover were recorded at the site in 2015¹⁶.

In lieu of conservation objectives for 'Benthic feeding seabirds' within the Farne Islands SPA; the CO of 'Maintain' is inferred from the data provided by the National Trust 2015 report on breeding birds on the Farne Islands.

7. Is the potential scale or magnitude of any effect likely to be significant?

Alone:	OR In-combination
No	No
*However a full Appropriate Assessment is required to confirm this.	

8. Have NE been consulted on this LSE	Yes
test? If yes, what was NE's advice?	
	Synthesis of evidence and local knowledge informing this
	decision occurred between January 2014 and the date of this
	document's creation with stakeholders (where appropriate) and
	other statutory authorities. Natural England (CS) was involved
	with this formal process.

Conclusion

Is the proposal likely to have a significant effect 'alone or in combination' on the Farne Islands SPA?

No, however a full Appropriate Assessment is required to confirm this.

Test for Likely Significant Effect (LSE)

FARNE-270: Water Column

1. Is the activity/activities directly	No
connected with or necessary to the	
management of the site for nature	
conservation?	

2. What pressures (such as abrasion, disturbance) are potentially exerted by the gear type(s)?

*Sensitivities as listed are based on DRAFT Interim conservation advice. No Regulation 33 or 35 Advice is available for the Farne Islands SPA and best judgement has been used to determine which of these pressures are truly exerted by the gear type(s).

Barrier to species movement (Sensitive)

Genetic modification & translocation of indigenous species (Sensitive)¹⁰

Hydrocarbon & PAH contamination. Includes those priority substances listed in Annex II of Directive 2008/105/EC. (Sensitive)¹¹

Introduction to light (Sensitive)9

Introduction of other substances (solid, liquid or gas) (Sensitive)¹²

Introduction or spread of non-indigenous species (Sensitive)³

Litter i.e. Ghost fishing (Sensitive)⁴

Organic enrichment (Sensitive)¹³

Removal of non-target species i.e. bycatch (Sensitive)⁵

Synthetic compound contamination (incl. pesticides, antifoulants, pharmaceuticals). Includes those priority substances listed in Annex II of Directive 2008/105/EC. (Sensitive)¹⁴

Transition elements & organo-metal (e.g. TBT) contamination. Includes those priority substances listed in Annex II of Directive 2008/105/EC.(Sensitive)¹⁴

Underwater noise changes (Sensitive)¹⁵

Visual disturbance (Sensitive)⁶

3. Is the feature potentially exposed to the pressure(s)?

Yes

4. What are the conservation objectives for the feature?

*DRAFT interim conservation advice does not give definitive conservation objectives. However, completing an HRA without COs is difficult. The CO as listed in this document is based on current knowledge of the status, and the pressures, affecting designated features (see sections 4 &5).

Expert judgement has been used to determine which features may be exposed to the pressure(s) resulting in inferred COs. These COs are assigned a degree of uncertainty i.e. a subjective confidence level based on evidence 'High', 'Medium,' 'Low', and 'Unknown'.

Conservation objectives for supporting habitat 'Coastal and offshore waters' for <u>all</u> designated SPA bird features are to **Maintain***

availability of preferred prey species (e.g. sandeel and sprat) at preferred prey sizes (Arctic tern and Sandwich tern)

*Confidence level for interim, inferred Conservation Objective: **LOW** (see section 6 for detail).

5. What are the potential effects/impacts of the pressure(s) on the feature, taking into account the exposure level?

Levels of netting activity within the surrounding waters of the Farne Islands SPA are currently very low, with just one or two boats known to set nets on an infrequent basis further north in Berwick. The SPA site is managed by the National Trust, and staff members have not observed nets set in close proximity of the site (Pers. Comms John Walton, Coastal & Marine Officer National Trust).

Bottom set, static netting activity within the district predominantly targets whitefish e.g. Cod, Saithe and Flatfish or lobsters for which mesh sizes are too large to capture smaller prey species such as sandeel and sprat. Static netting in the district, particularly at current low levels, is therefore not deemed to have a significant adverse impact on the water column within the Farne Islands SPA.

6. Condition and Conservation Objective Inferences

No evidence is available on the current condition of the 'water column' within the Farne Islands SPA. In lieu of a definitive conservation objective for this feature, a CO of 'Maintain' has been inferred, based on a low level of confidence.

No

7. Is the potential scale or magnitude of any effect likely to be significant?

Alone: OR In-combination

8. Have NE been consulted on this LSE test? If yes, what was NE's advice?

Yes

No

Synthesis of evidence and local knowledge informing this decision occurred between January 2014 and the date of this document's creation with stakeholders (where appropriate) and other statutory authorities. Natural England (CS) was involved with this formal process.

Conclusion

Is the proposal likely to have a significant effect 'alone or in combination' on the Farne Islands SPA?

No.
